Lecture 27:

- Exam-2 Overview
- Language Paradigms
- Models of Computation

Announcements:

- HW-6 out
- Proj Part 2 due
- Extra Credit proposal due Fri
- Exam 2 Mon

CPSC 326, Spring 2025

1

Exam 2 Overview

Basics:

- Closed notes, etc.
- Worth 60 points (10% of final grade)
- Four multipart questions

Notes:

- AST creation and traversal (HW-3)
- Semantic checking (HW-4)
- The MyPL VM and instructions
- Code Generation
- There will be coding questions (in Java)
- Use lecture notes, extended notes, quizzes, homeworks

Programming Language "Paradigms" There are many ways languages are categorized ... • script-based, object-oriented, dynamic vs static typing, memory-safety The three main language "paradigms" ... another categorization Logic Programming (1970's, Prolog) First-Order Logic (1800's) **Funcational** λ-calculus Imperative **Turing Machines** Programming (1950's, e.g., FORTRAN) Programming (1950's, LISP) (1930's) (1930's) Philosophy/Math/Early CS **Imperative**: Say how to solve problem, system carries out steps Declarative: Say what solution achieves, system determines how to compute it Logic and Functional languages are considered (more) declarative largely based on underlying models of computation used © S. Bowers CPSC 326, Spring 2025 3 **Turing Machines** Basic Idea: ... even lower level than RAM Machines! 1. Infinite tape of memory cells, each cell holds one symbol

- 2. **Read/write head** that can move left/right (L/R) one cell at a time
- 3. State register that stores the current state of the machine
- 4. *Transition table*: Curr State & Symbol \rightarrow New State, Symbol, & Direction

Example: replace a's with b's

Special blank ($_{\Box}$) symbol, and halting states q_{halt} , q_{yes} , q_{no} Many variants (e.g., multitape machines, non-deterministic)
